

To increase the reliability of fumes cleaning, our automatic control uses analyzers to continuously monitor HCL – dust – CO – SO₂ – Nox – COT and others. Besides being continuously monitored through paper recorders, these signals enable the automatic control to constantly evaluate if the entire plant is functioning properly, and is always within the values permitted by the regulations in force. Therefore - even in this case - it exploits the system's flexibility thanks to precise state-of-the-art planning and construction techniques. By modifying the parameters (set point) the system is always kept up to date and in conformity with the pertinent regulations.
